## Component Data

None of us has the time or space to collect all the literature available on the many different commercially available manufactured components. Even if we did, the task of keeping track of new and obsolete devices would surely be formidable. Fortunately, amateurs tend to use a limited number of component types. This chapter, by Douglas Heacock, AA0MS, provides information on the components most often used by the Amateur Radio experimenter.

## COMPONENT VALUES

Throughout this Handbook, composition resistors and smallvalue capacitors are specified in terms of a system of "preferred values." This system allows manufacturers to supply these components in a standard set of values, which, when considered along with component tolerances, satisfy the vast majority of circuit requirements.

The preferred values are based on a roughly logarithmic scale of numbers between 1 and 10 . One decade of these values for three common tolerance ratings is shown in Table 24.1.

The Table represents the two significant digits in a resistor or capacitor value. Multiply these numbers by multiples of ten to get other standard values. For example, $22 \mathrm{pF}, 2.2 \mu \mathrm{~F}, 220 \mu \mathrm{~F}$, and $2200 \mu \mathrm{~F}$ are all standard capacitance values, available in all three tolerances. Standard resistor values include $3.9 \Omega, 390 \Omega$, $39000 \Omega$ and $3.9 \mathrm{M} \Omega$ in $\pm 5 \%$ and $\pm 10 \%$ tolerances. All standard resistance values, from less than $1 \Omega$ to about $5 \mathrm{M} \Omega$ are based on this table.

Each value is greater than the next smaller value by a multiplier factor that depends on the tolerance. For $\pm 5 \%$ devices, each value is approximately 1.1 times the next lower one. For $\pm 10 \%$ devices, the multiplier is 1.21 , and for $\pm 20 \%$ devices, the multiplier is 1.47 . The resultant values are rounded to make up the series.

Table 24.1
Standard Values for Resistors and Capacitors

| $\pm 5 \%$ | $\pm 10 \%$ | $\pm 20 \%$ |
| ---: | :---: | :---: |
| 1.0 | 1.0 | 1.0 |
| 1.1 |  |  |
| 1.2 | 1.2 |  |
| 1.3 |  |  |
| 1.5 | 1.5 | 1.5 |
| 1.6 |  |  |
| 1.8 | 1.8 |  |
| 2.0 |  |  |
| 2.2 | 2.2 | 2.2 |
| 2.4 |  |  |
| 2.7 | 2.7 |  |
| 3.0 |  |  |
| 3.3 | 3.3 | 3.3 |
| 3.6 |  |  |
| 3.9 | 3.9 |  |
| 4.3 |  |  |
| 4.7 | 4.7 | 4.7 |
| 5.1 |  |  |
| 5.6 | 5.6 |  |
| 6.2 |  |  |
| 6.8 | 6.8 | 6.8 |
| 7.5 |  |  |
| 8.2 | 8.2 |  |
| 9.1 |  | 10.0 |
| 10.0 | 10.0 |  |

Tolerance refers to a range of acceptable values above and below the specified component value. For example, a $4700-\Omega$ resistor rated for $\pm 20 \%$ tolerance can have an actual value anywhere between $3760 \Omega$ and $5640 \Omega$. You may always substitute a closer-tolerance device for one with a wider tolerance. For projects in this Handbook, assume a $10 \%$ tolerance if none is specified.

## COMPONENT MARKINGS

The values, tolerances or types of most small components are typically marked with a color code or an alphanumeric code according to standards agreed upon by component manufacturers. The Electronic Industries Association (EIA) is a US agency that sets standards for electronic components, testing procedures, performance and device markings. The EIA cooperates with other standards agencies such as the International Electrotechnical Commission (IEC), a world-wide standards agency. You can often find published EIA standards in the engineering library of a college or university.

The standard EIA color code is used to identify a variety of electronic components. Most resistors are marked with color bands according to the code, shown in Table 24.2. Some types of capacitors and inductors are also marked using this color code.

## Resistor Markings

Carbon-composition, carbon-film, and metal-film resistors are typically manufactured in roughly cylindrical cases with axial leads. They are marked with color bands as shown in Fig 24.1A. The first two bands represent the two significant digits of the component value, the third band represents the multiplier, and the fourth band (if there is one) represents the tolerance. Some units are marked with a fifth band that represents the percentage of resistance change per 1000 hours of operation: brown $=1 \%$; red $=0.1 \%$; orange $=$ $0.01 \%$; and yellow $=0.001 \%$. Precision resistors (EIA Std RS-279, Fig 24.1B) and some mil-spec (MIL STD-1285A) resistors also use five color bands. On precision resistors,

Table 24.2
Resistor-Capacitor Color Codes

| Color | Significant <br> Figure | Decimal <br> Multiplier | Tolerance <br> $(\%)$ | Voltage <br> Rating |
| :--- | :--- | :--- | :--- | :--- |
| Black | 0 | 1 | - | - |
| Brown | 1 | 10 | $1^{*}$ | 100 |
| Red | 2 | 100 | $2^{*}$ | 200 |
| Orange | 3 | 1,000 | $3^{*}$ | 300 |
| Yellow | 4 | 10,000 | $4^{*}$ | 400 |
| Green | 5 | 100,000 | $5^{*}$ | 500 |
| Blue | 6 | $1,000,000$ | $6^{*}$ | 600 |
| Violet | 7 | $10,000,000$ | $7^{*}$ | 700 |
| Gray | 8 | $100,000,000$ | $8^{*}$ | 800 |
| White | 9 | $1,000,000,000$ | $9^{*}$ | 900 |
| Gold | - | 0.1 | 5 | 1000 |
| Silver | - | 0.01 | 10 | 2000 |
| No color | - | - | 20 | 500 |

[^0]the first three bands are used for significant figures and the space between the fourth and fifth bands is wider than the others, to identify the tolerance band. On the military resistors, the fifth band indicates reliability information such as failure rate.

For example, if a resistor of the type shown in Fig 24.1A is marked with $\mathrm{A}=$ red; $\mathrm{B}=$ red; $\mathrm{C}=$ orange; $\mathrm{D}=$ no color, the significant figures are 2 and 2 , the multiplier is 1000 , and the tolerance is $\pm 20 \%$. The device is a $22,000-\Omega, \pm 20 \%$ unit.

Some resistors are made with radial leads (Fig 24.1C) and are marked with a color code in a slightly different scheme. For example, a resistor as shown in Fig 24.1C is marked as follows: A (body) = blue; $\mathrm{B}(\mathrm{end})=$ gray; $\mathrm{C}(\operatorname{dot})=$ red; $\mathrm{D}(\mathrm{end})=$ gold. The significant figures are 6 and 8 , the multiplier is 100 , and the tolerance is $\pm 5 \% ; 6800 \Omega$ with $\pm 5 \%$ tolerance.

## Resistor Power Ratings

Carbon-composition and metal-film resistors are available in standard power ratings of $1 / 10,1 / 8,1 / 4$, $1 / 2,1$ and 2 W . The ${ }^{1 / 10^{-}}$and $1 / 8$-W sizes are relatively expensive and difficult to purchase in small quantities. They are used only where miniaturization is essential. The $\frac{1}{4}, \frac{1}{2}, 1$, and 2 -W composition resistor packages are drawn to scale in Fig 24.2. Metal-film resistors are typically slightly smaller than carbon-composition units of the same power rating. Film resistors can usually be identified by a glossy enamel coating and an hourglass profile. Carbon-film and metal-film are the most commonly available resistors today, having largely replaced the less-stable carbon-composition resistors.

## Capacitor Markings

A variety of systems for capacitor markings are in use. Some use color bands, some use combinations of numbers and letters. Capacitors may be marked with their value, tolerance, temperature characteristics, voltage ratings or some subset of these specifications. Fig 24.3 shows several popular capacitor marking systems.

In addition to the value, ceramic disk capacitors may be marked with an alphanumeric code signifying temperature characteristics. Table $\mathbf{2 4 . 3}$ explains the EIA code for ceramic-disk capacitor temperature characteristics. The code is made up of one character from each column in the table. For example, a capacitor marked Z5U is suitable for use between +10 and $+85^{\circ} \mathrm{C}$, with a maximum change in capacitance of $-56 \%$ or $+22 \%$.

Capacitors with highly predictable temperature coefficients of capacitance are sometimes used in

Fig 24.2-Typical carbon-composition resistor sizes.

Table 24.3
EIA Temperature Characteristic Codes for Ceramic Disc Capacitors

| Minimum temperature | Maximum temperature | Maximum capacitance change over temperature range |
| :---: | :---: | :---: |
| X $-55^{\circ} \mathrm{C}$ | $2+45^{\circ} \mathrm{C}$ | A $\pm 1.0 \%$ |
| Y $-30^{\circ} \mathrm{C}$ | $4+65^{\circ} \mathrm{C}$ | B $\pm 1.5 \%$ |
| Z $+10^{\circ} \mathrm{C}$ | $5+85^{\circ} \mathrm{C}$ | C $\pm 2.2 \%$ |
|  | $6+105^{\circ} \mathrm{C}$ | D $\pm 3.3 \%$ |
|  | $7+125^{\circ} \mathrm{C}$ | E $\pm 4.7 \%$ |
|  |  | F $\pm 7.5 \%$ |
|  |  | P $\pm 10 \%$ |
|  |  | R $\pm 15 \%$ |
|  |  | S $\pm 22 \%$ |
|  |  | T -33\%, +22\% |
|  |  | U -56\%, +22\% |
|  |  | $V-82 \%,+22 \%$ |

Fig 24.3-Capacitors can be identified by color codes and markings. Shown here are identifying markings found on many common capacitor types.
oscillators that must be frequency stable with temperature. If an application called for a temperature coefficient of $-750 \mathrm{ppm} /{ }^{\circ} \mathrm{C}$ (N750), a capacitor marked U2J would be suitable. The older industry code for these ratings is being replaced with the EIA code shown in Table 24.4. NP0 (that is, N-P-zero) means "negative, positive, zero;" it is a characteristic often specified for RF circuits requiring temperature stability, such as VFOs. A capacitor of the proper value marked C0G is a suitable replacement for an NP0 unit.

Some capacitors, such as dipped silver-mica units, have a letter designating the capacitance tolerance. These letters are deciphered in Table 24.5.

## Surface-Mount Resistor and Capacitor Markings

Many different types of electronic components, both active and passive, are now available in surface-mount packages. These are commonly-known as chip resistors and capacitors. The very small size of these components leaves little space for marking with conventional codes, so brief alphanumeric codes are used to convey the most information in the smallest possible space.

Surface-mount resistors are typically marked with a three- or four-digit value code and a character indicating tolerance. The nominal resistance, expressed in ohms, is identified by three digits for $2 \%$ (and greater) tolerance devices. The first two digits represent the significant figures; the last digit specifies the multiplier as the exponent of ten. (It may be easier to remember the multiplier as the number of zeros you must add to the significant figures.) For values less than $100 \Omega$, the letter R is substituted for one of the significant digits and represents a decimal point. Here are some examples:
Resistor Code Value
$101 \quad 10$ and 1 zero $=100 \Omega$
$224 \quad 22$ and 4 zeros $=220,000 \Omega$
1R0 $\quad 1.0$ and no zeros $=1 \Omega$
22R $\quad 22.0$ and no zeros $=22 \Omega$
R10 $\quad 0.1$ and no zeros $=0.1 \Omega$
If the tolerance of the unit is narrower than $\pm 2 \%$, the code used is a four-digit code where the first three digits are the significant figures and the last is the multiplier. The letter R is used in the same way to represent a decimal point. For example, 1001 indicates a $1000-\Omega$ unit, and 22 R0 indicates a $22-\Omega$ unit.

The tolerance rating for a surface-mount resistor is expressed with a single character at the end of the numeric value code, according to Table 24.6.

Surface-mount capacitors are marked with a two-character code consisting of a letter indicating the significant digits (see Table 24.7) and a number indicating the multiplier (see Table 24.8). The code represents the capacitance in picofarads. For example, a chip capacitor marked "A4" would have a capacitance of $10,000 \mathrm{pF}$, or $0.01 \mu \mathrm{~F}$. A unit marked " N 1 " would be a $33-\mathrm{pF}$ capacitor. If there is sufficient space on the device package, a tolerance code may be included (see Fig 24.3D for tolerance

Table 24.7
SMT Capacitor Significant Figures Code

| Character | Significant <br> Figures | Character | Significant <br> Figures |
| :--- | :--- | :--- | :--- |
| A | 1.0 | T | 5.1 |

codes). Surface-mount capacitors can be very small; you may need a magnifying glass to read the markings.

## INDUCTORS AND CORE MATERIALS

Inductors, both fixed and variable, are available in a wide variety of types and packages, and many offer few clues as to their values. Some coils and chokes are marked with the EIA color code shown in Table 24.2. See Fig $\mathbf{2 4 . 4}$ for another marking system for tubular encapsulated RF chokes.

Most powdered-iron toroid cores that we amateurs use are manufactured by Micrometals, who uses paint to identify the material used in the core. The Micrometals color code is part of Table 24.9. Table 24.10 gives the physical characteristics of powdered-iron toroids. Ferrite cores are not typically painted, so identification is more difficult. See Table $\mathbf{2 4 . 1 1}$ for information about ferrite cores.

Table 24.8
SMT Capacitor Multiplier Codes

Fig 24.4-Color coding for tubular encapsulated RF chokes. At A, an example of the coding for an $8.2-\mu \mathrm{H}$ choke is given. At B, the color bands for a $330-\mu \mathrm{H}$ inductor are illustrated. The color code is given in Table 24.2.

## TRANSFORMERS

Many transformers, including power transformers, IF transformers and audio transformers, are made to be installed on PC boards, and have terminals designed for that purpose. Some transformers are manufactured with wire leads that are color-coded to identify each connection. When colored wire leads are present, the color codes in Tables 24.12, 24.13 and 24.14 usually apply.

In addition, many miniature IF transformers are tuned with slugs that are color-coded to signify their application. Table 24.15 lists application vs slug color.

## SEMICONDUCTORS

Most semiconductor devices are clearly marked with the part number and in some cases, a manufacturer's date code as well. Identification of semiconductors can be difficult, however, when the parts are "house-marked" (marked with codes used by an equipment manufacturer instead of the stan-

## Inductance and Turns Formula

The turns required for a given inductance or inductance for a given number of turns can be calculated from:

$$
N=100 \sqrt{\frac{L}{A_{L}}} \quad L=A_{L}\left(\frac{N^{2}}{10,000}\right)
$$

where $N=$ number of turns; $L=$ desired inductance $(\mu \mathrm{H}) ; A_{L}=$ inductance index ( $\mu \mathrm{H}$ per 100 turns). ${ }^{*}$

## $A_{L}$ Values

|  |  |  |  |  |  |  |  |  |  |  |  |

* The units of $A_{L}$ ( $\mu \mathrm{H}$ per 100 turns) are an industry standard; however, to get a correct result use $A_{L}$ only in the formula above.
** Mix-26 is similar to the older Mix-41, but can provide an extended frequency range.

## Magnetic Properties Iron Powder Cores

| Mix | Color | Material | $\mu$ | Temp stability (ppm/ ${ }^{\circ} \mathrm{C}$ ) | $f(\mathrm{MHz})$ | Notes |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 26 | Yellow/white | Hydrogen reduced | 75 | 825 | dc - 1 | Used for EMI filters and dc chokes |
| 3 | Gray | Carbonyl HP | 35 | 370 | 0.05-0.50 | Excellent stability, good Q for lower frequencies |
| 15 | Red/white | Carbonyl GS6 | 25 | 190 | 0.10-2 | Excellent stability, good Q |
| 1 | Blue | Carbonyl C | 20 | 280 | 0.50-5 | Similar to Mix-3, but better stability |
| 2 | Red | Carbonyl E | 10 | 95 | 2-30 | High Q material |
| 7 | White | Carbonyl TH | 9 | 30 | 3-35 | Similar to Mix-2 and Mix-6, but better temperature stability |
| 6 | Yellow | Carbonyl SF | 8 | 35 | 10-50 | Very good Q and temp. stability for $20-50 \mathrm{MHz}$ |
| 10 | Black | Powdered iron W | 6 | 150 | 30-100 | Good Q and stability for 40-100 MHz |
| 12 | Green/white | Synthetic oxide | 4 | 170 | 50-200 | Good Q, moderate temperature stability |
| 17 | Blue/yellow | Carbonyl | 4 | 50 | 40-180 | Similar to Mix-12, better temperature stability, Q drops about $10 \%$ above $50 \mathrm{MHz}, 20 \%$ above 100 MHz |
| 0 | Tan | phenolic | 1 | 0 | 100-300 | Inductance may vary greatly with winding technique |

|  | not important) |

Note: These markings also apply to line-to-grid and tube-to-line transformers.
dard part numbers). In such cases, it is often possible to find the standard equivalent or a suitable replacement by using one of the semiconductor cross-reference directories available from various replacement-parts distributors. If you look up the house number and find the recommended replacement part, you can often find other standard parts that are replaced by that same part.

## Diodes

Most diodes are marked with a part number and some means of identifying which lead is the cathode. Some diodes are marked with a color-band code (see Fig 24.5). Important diode parameters include maximum forward current, maximum peak inverse voltage (PIV) and the power-handling capacity.

## Transistors

Some important parameters for transistor selection are voltage
and current limits, power-handling capability, beta or gain characteristics and useful frequency range. The case style may also be an issue; some transistors are available in several different case styles.

## Integrated Circuits

Integrated circuits (ICs) come in a variety of packages, including transistor-like metal cans, dual and single in-line packages (DIPs and SIPs), flat-packs and surface-mount packages. Most are marked with a part number and a four-digit manufacturer's date code indicating the year (first two digits) and week (last two digits) that the component was made. ICs are frequently house-marked, and the cross-reference directories mentioned above can be helpful in identification and replacement.

Another very useful reference tool for working with ICs is IC Master, a master selection guide that organizes ICs by type, function and certain key parameters. A part number index is included, along with application notes and manufacturer's information for tens of thousands of IC devices. Some of the data from IC Master is also available on computer disks.

IC part numbers usually contain a few digits that identify the circuit die or function and several other letters and/or digits that identify the production process, manufacturer and package. For example, a '4066 IC contains four independent SPST switches. Harris (CD74HC4066, CD4066B and CD4066BE), National (MM74HC4066, CD4066BC and CD4066BM) and Panasonic (MN74HC4066 and MN4066B) all make similar devices (as do many other manufacturers) with slight differences. Among the numbers listed, "CD" (CMOS Digital), "MM" (MOS Monolithic), and "MN" indicate CMOS parts. "74" indicates a commercial quality product (for applications from $0^{\circ} \mathrm{C}$ to $70^{\circ} \mathrm{C}$ ), which is pin compatible with the 74/ 54 TTL families. "HC" means high-speed CMOS family, which is as fast as the LS TTL family. The "B" suffix, as is CD4066B, indicates a buffered output. This is only a small example of the conventions used in IC part numbers. For more information look at data books from the various manufacturers. Base diagrams for many common ICs appear in The ARRL Electronics Data Book.

When choosing ICs that are not exact replacements, several operating needs and performance aspects should be considered. First, the replacement power requirements must be met: Some ICs require 5 V dc, others 12 V and some need both positive and negative supplies. Current requirements vary among the various IC families, so be sure that sufficient current is available from the power supply. If a replacement IC uses much more current than the device it replaces, a heat sink or blower may be needed to keep it cool.

Next consider how the replacement interacts with its neighboring components. Input capacitance and "fanout" are critical factors in digital circuits. Increased input capacitance may overload the driving circuits. Overload slows circuit operation, which may prevent lines from reaching the "high" condition. Fanout tells how many inputs a device can drive. The fanout of a replacement should be equal to, or greater than, that required in the circuit. Operating speed and propagation delay are also significant. Choose a replacement IC that operates at or above the circuit clock speed. (Although increased speed can increase EMI and cause other problems.) Some circuits may not function if the propagation delay varies much from the specified part. Look at the Digital chapter for details of how these operating characteristics relate to circuit performance.

Analog ICs have similar characteristics. Input and output capacities are often defined as how much current an analog IC can "sink" (accept at an input) or "source" (pass to a load). A replacement should be able to source or sink at least as much current as the device it replaces. Analog speed is sometimes listed as bandwidth (as in discrete-component circuits) or slew rate (common in op amps). Each of these quantities should meet or exceed that of the replaced component.

Some ICs are available in different operating temperature ranges. Op amps, for example, are commonly available in three standard ranges:

- Commercial $0^{\circ} \mathrm{C}$ to $70^{\circ} \mathrm{C}$
- Industrial $-25^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$
- Military $-55^{\circ} \mathrm{C}$ to $125^{\circ} \mathrm{C}$

In some cases, part numbers reflect the temperature ratings. For example, an LM301A op amp is rated for the commercial temperature range; an LM201A op amp for the industrial range and an LM101A for the military range.

When necessary, you can add interface circuits or buffer amplifiers that improve the input and output capabilities of replacement ICs, but auxiliary circuits cannot improve basic device ratings, such as speed or bandwidth.

An excellent source of information on many common ICs is The ARRL Electronics Data Book, which contains detailed data for digital ICs (CMOS and TTL), op amps and other analog ICs.

## OTHER SOURCES OF COMPONENT DATA

There are many sources you can consult for detailed component data. Many manufacturers publish data books for the components they make. Many distributors will include data sheets for parts you order if you ask for them. Parts catalogs themselves are often good sources of component data. The following list is representative of some of the data resources available from manufacturers and distributors.

| 32 | $7 \times 40$ |  |  | 47.6 |

## Notes

${ }^{1}$ A circular mil (CM) is a unit of area equal to that of a one-mil-diameter circle ( $\pi / 4$ square mils). The CM area of a wire is the square of the mil diameter.
2 Figures given are approximate only; insulation thickness varies with manufacturer.
${ }^{3}$ Maximum wire temperature of $212^{\circ} \mathrm{F}\left(100^{\circ} \mathrm{C}\right)$ with a maximum ambient temperature of $13^{\circ} \mathrm{F}\left(57^{\circ} \mathrm{C}\right)$ as specified by the manufacturer. The National Electrical Code or local building codes may differ.
4700 CM per ampere is a satisfactory design figure for small transformers, but values from 500 to 1000 CM are commonly used. The National Electrical Code or local building codes may differ.
5 Stranded wire construction is given as "count" $\times$ "strand size" (AWG).

## Color Code for Hookup Wire

| Wire Color | Type of Circuit <br> Grounds, grounded elements and <br> returns |
| :--- | :--- |
| Black | Heaters or filaments, off ground |
| Brown | Power Supply B plus |
| Red | Ocreen grids and base 2 of transistors |
| Orange | Cathodes and transistor emitters |
| Yellow | Control grids, diode plates, and base 1 <br> Green <br> of transistors |
| Blue | Plates and transistor collectors |
| Violet | Power supply, minus leads |
| Gray | Ac power line leads <br> White |
| Bias supply, B or C minus, AGC |  |

Note: Wires with tracers are coded in the same manner as solid-color wires, allowing additional circuit identification over solid-color wiring. The body of the wire is white and the color band spirals around the wire lead. When more than one color band is used, the widest band represents the first color.

## Aluminum Alloy Characteristics

## Common Alloy Numbers

## Type Characteristic

2024 Good formability, high strength
5052 Excellent surface finish, excellent corrosion resistance, normally not heat treatable for high strength
6061 Good machinability, good weldability, can be brittle at high tempers
7075 Good formability, high strength

## General Uses

Type Uses
2024-T3 Chassis boxes, antennas, anything that will be bent or flexed repeatedly
7075-T3
6061-T6 Mounting plates, welded assemblies or machined parts

## Common Tempers

Type Characteristics
T0 Special soft condition
T3 Hard
T6 Very hard, possibly brittle
TXXX Three digit tempers-usually specialized high-strength heat treatments, similar to T6

## Crystal Holders

Note: Solder Seal, Cold Weld, and Resistance Weld sealing methods are commonly available. All dimensions are in inches

HC6/U

HC17/U *

* Note: HC17/U pin spacing and diameter is equivalent
to the older FT-243 (32 pF) holder.

| PIN | CONNECTION |
| :---: | :--- |
| 1 | No Connection |

| 4 | Crystal |

HC 35 (TO-5)

HC 40 (TL-90)

HC13/U

HC18/U

HC33/U

HC 47 (TL-31)

* Note: HC17/U pin spacing and diameter is equivalent to the older FT-243 (32 pF) holder.

## Miniature Lamp Guide

** Bulbs are described by a letter indicating shape and a number that is an approximation of diameter expressed in eighths of an inch. For example $S-8$ is " $S$ " shape, 8 eighths or 1 inch in diameter.

| 5082-2835 | Schottky | Si | 8 | 1 m (100 n) | 10 m | 0.34 @ 1 mA |

$\mathrm{Si}=$ Silicon; $\mathrm{Ge}=$ Germanium; RFR = rectifier, fast recovery.
$\dagger$ For package shape, size and pin-connection information see manufacturers' data sheets. Many retail suppliers offer data sheets to buyers free of charge on request. Data books are available from many manufacturers and retailers.

## European Semiconductor Numbering System (PRO Electron Code)

## Japanese Semiconductor Nomenclature

All transistors manufactured in Japan are registered with the Electronic Industries Association of Japan (EIAJ). In addition, the Japan industrial Standard JIS-C-7012 provides type numbers for transistors and thyristors.
Each transistor type number contains five elements.

| $\frac{i}{2}$ | $\frac{i i}{S}$ | $\frac{\text { iii }}{\mathrm{C}}$ | $\frac{\mathrm{iv}}{82 \mathrm{D}}$ | $\frac{v}{\mathrm{~A}}$ |
| :--- | :--- | :--- | :--- | :--- |

Figure Letter Letter Figure Letter
i) Kind of device, indicating number of effective electrical connections minus one.
ii) For a semiconductor registered with the EIAJ this letter is always an S.
iii) This letter designates polarity and application, as follows:

Letter Polarity and Application
A PNP transistor, high frequency
B PNP transistor, low frequency
C NPN transistor, high frequency
D NPN transistor, low frequency
E $\quad \mathrm{P}$-gate thyristor
G $\quad \mathrm{N}$-gate thyristor
H $\quad \mathrm{N}$-base unijunction transistor
$J \quad$ P-channel FET
K $\quad$-channel FET
M Bi-directional triode thyristor
iv) These figures designate the order of application for EIAJ registration, starting with 11.
v) This letter indicates the level of improvement. An improvement device may be used in place of a previous-generation device, but not necessarily the other way around.

## Three-Terminal Voltage Regulators

Listed numerically by device

| Device | Description | Package | Voltage | Current (Amps) |
| :---: | :---: | :---: | :---: | :---: |
| 317 | Adj Pos | TO-205 | +1.2 to +37 | 0.5 |
| 317 | Adj Pos | TO-204,TO-220 | +1.2 to +37 | 1.5 |
| 317L | Low Current Adj Pos | TO-205,TO-92 | +1.2 to +37 | 0.1 |
| 317M | Med Current Adj Pos | TO-220 | +1.2 to +37 | 0.5 |
| 338 | Adj Pos | TO-3 | +1.2 to +32 | 5.0 |
| 350 | High Current Adj Pos | TO-204,TO-220 | +1.2 to +33 | 3.0 |
| 337 | Adj Neg | TO-205 | -1.2 to -37 | 0.5 |
| 337 | Adj Neg | TO-204,TO-220 | -1.2 to -37 | 1.5 |
| 337M | Med Current Adj Neg | TO-220 | -1.2 to -37 | 0.5 |
| 309 |  | TO-205 | +5 | 0.2 |
| 309 |  | TO-204 | +5 | 1.0 |
| 323 |  | TO-204,TO-220 | +5 | 3.0 |
| 140-XX | Fixed Pos | TO-204,TO-220 | Note 1 | 1.0 |
| 340-XX |  | TO-204,TO-220 |  | 1.0 |
| 78XX |  | TO-204,TO-220 |  | 1.0 |
| 78LXX |  | TO-205,TO-92 |  | 0.1 |
| 78MXX |  | TO-220 |  | 0.5 |
| 78TXX |  | TO-204 |  | 3.0 |
| 79XX | Fixed Neg | TO-204,TO-220 | Note 1 | 1.0 |
| 79LXX |  | TO-205,TO-92 |  | 0.1 |
| 79MXX |  | TO-220 |  | 0.5 |

Note $1-\mathrm{XX}$ indicates the regulated voltage; this value may be anywhere from 1.2 V to 35 V . A 7815 is a positive $15-\mathrm{V}$ regulator, and a 7924 is a negative $24-\mathrm{V}$ regulator.

The regulator package may be denoted by an additional suffix, according to the following:

| Package | Suffix |
| :--- | :--- |
| TO-204 (TO-3) | K |
| TO-220 | T |
| TO-205 (TO-39) | H, G |
| TO-92 | P, Z |

For example, a 7812 K is a positive $12-\mathrm{V}$ regulator in a TO-204 package. An LM340T-5 is a positive $5-\mathrm{V}$ regulator in a TO-220 package. In addition, different manufacturers use different prefixes. An LM7805 is equivalent to a $\mu \mathrm{A} 7805$ or MC7805.

FIG 11

12FB

Alphabetical subscripts ( $\mathrm{D}=$ diode, $\mathrm{P}=$ pentode, $\mathrm{T}=$ triode and $\mathrm{HX}=$ hexode ) indicate structures in multistructure tubes. Subscript CT indicates filament or heater center tap.
Generally, when pin 1 of a metal-envelope tube (except all triodes) is shown connected to the envelope, pin 1 of a glass-envelope counterpart (suffix G or GT) is connected to an internal shield.

## Properties of Common Thermoplastics

## Polyvinyl Chloride (PVC)

Advantages:
-can be compounded with plasticizers, filters, stabilizers, lubricants and impact modifiers to produce a wide range of physical properties
-can be pigmented to almost any color
-Rigid PVC has good corrosion and stain resistance, thermal \& electrical insulation, and weatherability

## Disadvantages:

-base resin can be attacked by aromatic solvents, ketones, aldehydes, naphthalenes, and some chloride, acetate, and acrylate esters
-should not be used above $140^{\circ}$

## Applications:

- conduit
- conduit boxes
- electrical fittings
-housings
- pipe
- wire and cable insulation

## Polystyrene

## Advantages:

- low cost
- moderate strength
- electrical properties only slightly affected by temperature and humidity
- sparkling clarity
-impact strength is increased by blending with rubbers, such as polybutadiene

## Disadvantages:

-brittle

- low heat resistance

Applications:

- capacitors
- light shields
-knobs

## Polyphenylene Sulfide (PPS)

## Advantages:

-excellent dimensional stability

- strong
- high-temperature stability
- chemical resistant
- Inherently completely flame retardant
- completely transparent to microwave radia. tion.

## Applications

R3-R5 have various glass-fiber levels that are suitable for applications demanding high mechanical and impact strength as well as good dielectric properties.
R8 and R10 are suitable for high arc-resistance applications
R9-901 is suitable for encapsulation of electronic devices

## Polypropylene

## Advantages:

- low density
-good balance of thermal, chemical, and electrical properties
- moderate strength (increases significantly with glass-fiber reinforcement)

## Disadvantages:

- Electrical properties affected to varying degrees by temperature (as temperature goes up, dielectric strength increases and volume resistivity decreases.)
- Inherently unstable in presence of oxidative and UV radiation
Applications:
- Automotive battery cases
- blower housings
- fan blades
- fuse housings
- insulators
- lamp housings
- supports for current-carrying electrical components.
-TV yokes

## Polyethylene (PE)

Advantages: Low Density PE

- Good toughness
- excellent chemical resistance
- excellent electrical properties
- low coefficient of friction
-near zero moisture absorption
-easy to process
-relatively low heat resistance

## Disadvantage

-susceptible to environmental and some chemical stress cracking

- wetting agents (such as detergents) accelerate stress cracking
Advantages: High Density PE
- Same as above, plus increased rigidity and tensile strength

## Advantages: Ultra-High Molecular Weight PE

- outstanding abrasion resistance
- low coefficient of friction
- high impact strength
- excellent chemical resistance
- material does not break in impact strength tests using standard notched specimens

## Applications:

-bearings

- components requiring maximum abrasion resistance, impact strength, and low coefficent of friction

Phenolic

## Advantages:

- low cost
-superior heat resistance
- high heat-deflection temperatures
- good electrical properties
- good flame resistance
- excellent moldability
-excellent dimensional stability
-good water and chemical resistance

## Applications:

- commutators and housings for small motors
- heavy duty electrical components
- rotary-switch wafers
- insulating spacers

## Nylon

## Advantages

- excellent fatigue resistance
- low coefficient of friction
- toughness a function of degree of crystallinity
- resists many fuels and chemicals
- good creep- and cold-flow resistance as compared to less rigid thermoplastics
- resists repeated impacts

Disadvantages:

- all nylons absorb moisture
- nylons that have not been compounded with a UV stabilizer are sensitive to UV light, and thus not suitable for extended outdoor use

## Applications

- bearings
- housing and tubing
- rope
- wire coatings
- wire connectors
- wear plates

## N Adapters

| Military No. | Style | Notes |
| :--- | :--- | :--- |
| UG-29,A,B | Str $(\mathrm{f} / \mathrm{f})$ | $50 \Omega$, TFE ins. |
| UG-57A.B | Str $(\mathrm{m} / \mathrm{m})$ | $50 \Omega$, TFE ins. |
| UG-27A,B | Ang $(\mathrm{f} / \mathrm{m})$ | Mitre body |
| UG-212A | Ang $(\mathrm{f} / \mathrm{m})$ | Mitre body |
| UG-107A | T $(\mathrm{f} / \mathrm{m} / \mathrm{f})$ | - |
| UG-28A | T $(\mathrm{f} / \mathrm{f} / \mathrm{f})$ | - |
| UG-107B | T $(\mathrm{f} / \mathrm{m} / \mathrm{f})$ | - |

## Family Characteristics:

N connectors with gaskets are weatherproof. RF leakage: $-90 \mathrm{~dB} \min @ 3 \mathrm{GHz}$. Temperature limits: TFE: $-67^{\circ}$ to $390^{\circ} \mathrm{F}\left(-55^{\circ}\right.$ to $\left.199^{\circ} \mathrm{C}\right)$. Insertion loss 0.15 dB max @ 10 GHz . Copolymer of styrene: $-67^{\circ}$ to $185^{\circ} \mathrm{F}$ $\left(-55^{\circ}\right.$ to $\left.85^{\circ} \mathrm{C}\right)$. Frequency range: $0-11 \mathrm{GHz}$. Maximum voltage rating: $1500 \mathrm{~V} \mathrm{P}-\mathrm{P}$. Dielectric withstanding voltage 2500 V RMS. SWR (MIL-C-39012 cable connectors) $1.3 \mathrm{max} 0-11 \mathrm{GHz}$.

| UG-274A,B | T $(\mathrm{f} / \mathrm{m} / \mathrm{f})$ | Berylium outer contact |

## Family Characteristics:

$Z=50 \Omega$. Frequency range: 0-4 GHz w/low reflection; usable to 11 GHz . Voltage rating: 500 V P-P. Dielectric withstanding voltage 500 V RMS. SWR: $1.3 \mathrm{max} 0-4 \mathrm{GHz}$. RF leakage -55 dB min @ 3 GHz . Insertion loss: 0.2 dB max @ 3 GHz . Temperature limits: TFE: $-67^{\circ}$ to $390^{\circ} \mathrm{F}\left(-55^{\circ}\right.$ to $\left.199^{\circ} \mathrm{C}\right)$; Rexolite insulators: $-67^{\circ}$ to $185^{\circ} \mathrm{F}\left(-55^{\circ}\right.$ to $\left.85^{\circ} \mathrm{C}\right)$. "Nwx" $=$ not weatherproof.

## HN Connectors

| Military No. | Style | Cable RG- | Notes |
| :--- | :--- | :--- | :--- |
| UG-59A | Str (m) | 8, 9, 213, 214 |  |
| UG-1214 | Str (f) | $8,9,87,213,214,225$ | Captivated contact |
| UG-60A | Str (f) | $8,9,213,214$ | Copolymer of styrene ins. |
| UG-1215 | Pnl (f) | $8,9,87,213,214,225$ | Captivated contact |
| UG-560 | Pnl (f) |  |  |
| UG-496 | Pll (f) |  | Berylium outer contact |

## Family Characteristics:

Connector Styles: Str = straight; Pnl = panel; Ang = Angle; Blkhd = bulkhead. Z = $50 \Omega$. Frequency range = $0-4 \mathrm{GHz}$. Maximum voltage rating $=1500 \mathrm{~V}$ P-P. Dielectric withstanding voltage $=5000 \mathrm{~V}$ RMS SWR $=1.3$. All HN series are weatherproof. Temperature limits: TFE: $-67^{\circ}$ to $390^{\circ} \mathrm{F}\left(-55^{\circ}\right.$ to $199^{\circ} \mathrm{C}$ ); copolymer of styrene: $-67^{\circ}$ to $185^{\circ} \mathrm{F}\left(-55^{\circ}\right.$ to $85^{\circ} \mathrm{C}$ ).

## Cross-Family Adapters

| Families | Description | Military No. |
| :--- | :--- | :--- |
